

Safer Water, North Texas

2019 Frisco City Council Candidate Q&A

Bill Woodard

1) Are you satisfied with the current status of Frisco's water quality, including the annual chlorine maintenance?

Yes, NTMWD follows industry best practices.

2) If not, what are your concerns about Frisco's water?

N/A

3) What do you believe you could do as a Frisco City Council member to change the Frisco water quality?

Our water is provided by NTMWD under State and Federal regulatory guidance. It is of the highest quality and meets all testing standards. Frisco also performs additional testing during the annual maintenance cycle and other times as needed. I will continue to support our staff in following industry best practices for monitoring our water quality.

4) If you are an incumbent, what have you done in the past 2 years that provides voters with insight regarding your possible future actions if re-elected?

With over a decade of service to the City in a variety of capacities including 6 years on Planning and Zoning and 3 years on council I've voted on thousands of items. I believe that record speaks for itself. There could be hundreds of issues alone in the last 2 years that would be of interest to residents and I'm always available to speak with anyone regarding any issue. I can be reached at 214-945-3366

5) Will you take responsibility to ensure that all Frisco water towers and water tanks are cleaned on the inside at least once every 3 years?

I support our current process and the industry best practices. Current processes include the following:

The City hires a third-party tank inspection service to inspect all of our tanks on an annual basis, internally and externally. The TCEQ provides best management practices related to tank inspections. This service gives the City an evaluation of the tanks working condition, and any necessary maintenance activities are then completed or included in the City's budgeting cycle.

In addition to this annual inspection, the City temporarily removes one storage tank from service each year for a comprehensive life cycle inspection and report. The report covers every aspect of the tank's life expectancy, and is a five to ten year planning tool, rather than

an inspection to identify immediate needs. Removing the tank from service includes it being emptied, cleaned and then inspected in a dry condition. When the inspection is complete the tank is disinfected and placed back in service.

Individually each water storage tank is visually inspected annually for proper operation and maintenance, which includes cleaning as needed. Then every seven to ten years, the same tank is taken out service inspected dry, resulting a complete wash out and disinfection. With tanks being inspected annually, and cleaned as needed, I believe we are providing maintenance that exceeds a singular 3 year clean out.
